

Data retention and disposal policy

Policy owner: Managing Member · Review due: September 2027

Contact: hello@whagons.com · whagons.com/en/data-retention

This policy records the current retention controls and the proposed retention schedule for Whagons Systems LLC. Proposed controls are not implemented or verified guarantees. The implementation gaps below remain open as of September 28, 2026.

1. Scope

This policy applies to Whagons Systems LLC and to anyone who works on its systems. It covers these categories of information:

- Platform data that customers upload to or create in Whagons, such as tasks, forms, files, comments, and operational records.
- Customer account, user, and billing data.
- Website and lead data, such as demo requests, briefs, Hotel Operations Score results, and marketing contacts.
- Technical and security logs from our servers.
- Financial account data received through Plaid.

2. Current use of Plaid

The Life finance integration is intended for an internal, read-only personal finance dashboard for the company owner. Its code requests the Plaid Transactions product and retrieves account balances. It does not initiate payments or transfers. This policy does not certify production access approval or that any live bank accounts are connected.

A customer-facing Plaid integration would require a separate review and an updated policy before launch.

3. Current retention and known gaps

- Life currently stores financial transactions and balances in its append-only events table. Disconnecting a Plaid item does not erase those previously collected records. No automatic finance purge or maximum retention period has been verified.
- Life also retains raw behavioral events indefinitely so that interpretations can be recomputed. Proposed finance deletion must be scoped separately from behavioral history; this policy does not claim that behavioral events are currently erased.
- The disconnect code attempts Plaid /item/remove and removes the encrypted token from the active item list. It currently suppresses errors from Plaid, so local removal is not proof that upstream revocation succeeded.
- Production backup expiry, restore-time deletion replay, customer offboarding deletion, vendor cleanup, and local export cleanup have not been verified against the proposed periods below.

4. Proposed retention schedule

These are implementation targets, not current enforced maximums. The policy owner must verify the relevant deletion workflows and backup settings before describing these periods as operational guarantees.

- Customer platform, account and user data: target deletion from production within 90 days after the subscription ends, subject to export arrangements and legal holds.
- Invoices, accounting and tax records: proposed 7-year retention, subject to applicable requirements. This is a proposed business schedule, not a statement that every U.S. tax record requires seven years.
- Website and lead data: target deletion within 24 months after the last interaction, or earlier on request, with a minimal suppression record to honor unsubscribes.
- Hotel Operations Score answers: the browser storage code expires saved answers after 24 hours when reading them. This does not establish deletion of copies sent to lead-management providers.
- Technical and security logs: proposed maximum of 12 months.
- Plaid access tokens: target verified revocation and removal on disconnect, including failure handling and retries.
- Plaid transactions and balances: target production deletion within 30 days after disconnect or a verified deletion request.
- Backups: target expiry of deleted production data within a further 90 days. Backup inventory and enforcement remain to be verified.

5. How we protect data received through Plaid

The reviewed Life code implements the following controls. These statements describe application behavior; they do not certify the configuration of every deployed environment.

- Bank credentials are entered in Plaid Link. They never reach our servers.
- Plaid access tokens are encrypted with AES-256-GCM in the application before they are written to the database. The encryption key lives in the server configuration, not in the database.
- Transactions and balances are stored in PostgreSQL. Finance routes accept an authenticated owner session or the shared Life bearer token. The bearer token is not limited to ingest access.
- Access is read-only. We do not initiate payments or transfers.
- The standard finance summary supplied to the coach contains aggregates such as category totals, merchant totals and balances, rather than individual transactions or access tokens. This is not an access-control boundary for an agent with broader server or database access.

6. Proposed disposal controls

These controls remain implementation or verification work.

- Confirm successful Plaid revocation, retain a retryable failure state when revocation fails, and verify deletion of the active encrypted token.
- Implement and test scoped deletion of financial records and derived copies without deleting unrelated behavioral events.
- Inventory backups, enforce expiry, and re-apply completed deletions before restoring service from an older backup.
- Token revocation prevents future API use only after it succeeds. It does not erase collected data. The current shared encryption key is not destroyed on disconnect, so this is not cryptographic erasure of stored copies.
- Verify deletion of related files, vendor copies and local exports, and record completion evidence.

7. Deletion requests

Send deletion requests to hello@whagons.com. We will verify the requester and assess the affected systems. Completion within 30 days is the proposed service target, not a verified end-to-end capability today. A confirmation must distinguish deleted production data from any retained copies or legal holds.

Anyone who connected an account through Plaid can also revoke that access in the Plaid Portal (my.plaid.com).

If a request concerns data that a customer uploaded to the platform, we coordinate it with that customer, who controls that data.

8. Legal holds

Where an applicable legal obligation requires retention, the policy owner must document the affected records, reason and duration before authorizing deletion. Automated legal-hold enforcement has not been verified.

9. Owner and review

The Managing Member of Whagons Systems LLC owns this policy and is responsible for carrying it out.

The owner must review this policy at least annually and before any material change in data use. The next review is due by September 2027. Proposed controls may be relabeled as current only after implementation and verification.
